

Steps taken to pre-process the data

The data was downloaded from TCGA¹ and the clinical.tsv file is used as input for the first stage of preprocessing, in which columns that have a very large volume of missing data will be removed.

In the second stage, carried out by TableauPrepStep2, the null values of the dataset columns were unified. Columns that have the same information were unified.

Figure 1 - Preprocessing steps using Tableau Prep

The file dados.csv was imported into the notebook using pandas and some more preprocessing steps were performed. Table 1 shows the values used to fill in the missing data.

Table 1 Filling in missing data

Attribute	Value
cause_of_death	not_reported
ethnicity	not_reported
gender	not_reported
race	not_reported
